

Japan Information Distribution Platform Act ("IDPA") Annual Transparency Report

May 31, 2026

1. Basic Information, Scope and Definitions

This section provides foundational context for the report, including: the reporting scope and key definitions used throughout (Section 1.1); the key terms referenced in this report (Section 1.2); an overview of Meta and its approach to content moderation (Section 1.3); and the cumulative volume of content and accounts on each designated platform during the reporting period (Section 1.4).

1.1 Reporting Scope & Definitions

This report is submitted pursuant to Article 28 of the Act (defined below), and covers the following services designated under the Act: Facebook, Instagram, and Threads (collectively, the "Services"). The quantitative figures in this report are provided on a per-service basis (i.e., Facebook, Instagram and Threads individually), while all the qualitative descriptions are provided on a Meta Platforms, Inc. basis across the Services, unless expressly stated otherwise. The reporting period for this report is July 30, 2025 to March 31, 2026.

This report aims to provide transparency into Meta's processes, performance, and compliance with the requirements of the Act, the Ordinance, and the Guidelines (defined below).

The data presented in this report has been compiled in good faith using Meta's available reporting and enforcement systems. Data limitations are noted in the relevant sections. Meta is committed to improving its data capture and reporting processes for future reporting periods.

1.2 Key Definitions

For the purposes of this report:

- **"Act"** (or **"IDPA"**) refers to the Act on Measures Against Infringement of Rights, Etc. Arising from Distribution of Information by Specified Telecommunications.
- **"Community Standards"** refers to Meta's publicly available content policies that define what is and is not allowed on the Services, as published online on the Meta Transparency Center at <https://transparency.meta.com/>.
- **"Ordinance"** or **"Ord."** refers to the Ordinance for Enforcement of the Act.
- **"Guidelines"** refers to the Guidelines on Obligations of Large-scale Specified Telecommunications Service Providers under the Act.
- **"Local Law Violations"** refers to infringements of the covered rights and interests set out in the Guidelines to Article 26 of the Act.
- **"Request"** (or **"report"**) refers to a request to take action on content or an account submitted through the IDPA reporting channel by a user or non-user.
- **"Reporter"** refers to the person submitting a request through the IDPA reporting channel.
- **"Reporting Period"** refers to the period of July 30, 2025 to March 31, 2026.
- **"Sender"** (or **"actor"**) refers to the user who posted the relevant information that is the subject of the request.

- **"Services"** refers to Facebook, Instagram, and Threads, being the services designated under the Act and covered in this report.
- **"Transmission Prevention Standard"** refers to the criteria applied by Meta in determining whether to take transmission prevention measures against content on the Services, including Meta Community Standards and applicable local law requirements, as further described in Section 5 of this report.
- **"Transmission Prevention Measures"** refers to measures taken to prevent the transmission or dissemination of infringing, illegal, or otherwise actioned information on the Services for users in Japan, as required to be described under Article 28(iv) of the IDPA and related Ord. provisions.

1.3 About Meta and Meta's Approach to Content Moderation

Meta builds technologies that help people connect, find communities, and grow businesses. Facebook, Instagram, and Threads help users connect with friends, family, and communities of people who share their interests. Meta is committed to giving people a voice while keeping them safe.

Meta's approach to content moderation is set out in detail in [Meta Transparency Center](#), which provides further information on the following topics:

Policies and User Controls

Meta maintains a set of globally applicable [Community Standards](#) that define what is and is not allowed on Facebook, Instagram, and Threads. In addition, Meta has [Advertising Standards](#) in place for advertising and Commerce Policies applicable to the sale of products and services.

Meta collaborates with global experts in technology, public safety, and human rights when developing these policies. More information on how Meta develops and improves its policies is available in Meta Transparency Center at: <https://transparency.meta.com/policies/improving>.

Our Community Standards, other content policies, and terms are made available in Japanese to ensure accessibility and transparency for users of Meta's services in Japan.

Meta also provides controls that enable people to take action in relation to content or accounts - including the ability to report content they believe violates our policies, block or restrict accounts, manage the content they see, and control who can interact with them. Further information is available on the Help Centers for [Facebook](#) and [Instagram \(and Threads\)](#).

Enforcement

Meta uses a combination of technology and human review teams to detect, review, and take action on millions of pieces of content and accounts every day on Facebook, Instagram, and Threads. Meta is deploying more advanced AI systems across its platforms to transform its approach to content enforcement, more accurately finding and removing severe content violations and illegal content, so people see less of them. These advanced AI systems cover languages spoken by approximately 98% of people online, significantly expanding on previous coverage of around 80 languages.

In most cases, enforcement happens automatically, with technology detecting, restricting, and removing content and accounts that may violate Meta's policies. In other cases, Meta's technology selects content for human review. Human oversight is embedded at multiple stages of the enforcement process, including through quality assurance reviews of automated decisions. For a detailed explanation of how Meta detects and acts on potential violations, see the Meta Transparency Center at:

<https://transparency.meta.com/enforcement/detecting-violations>.

Removals and Restrictions

Meta removes harmful content when it becomes aware that the content violates its policies. Meta also reduces the distribution of problematic content that does not violate its policies, and informs people with additional context so they can decide what to click, read, or share.

Meta removes accounts that are used to egregiously or persistently violate its policies across Meta's services, including those that compromise the security of other accounts and our services. Meta may also restrict access to locally unlawful content within a relevant jurisdiction in response to a legal request or regulatory requirement.

Transparency and Accountability

Meta regularly publishes transparency reports to provide the public with visibility into how it enforces its policies. These include:

- The [Community Standards Enforcement Report](#), which provides comprehensive global data on how Meta enforces its Community Standards across Facebook and Instagram.
- The [Content Restrictions Report](#), which provides country-level data on content restricted in response to government requests or in compliance with local law.

In addition, Meta publishes a [Responsible Business Practices Report](#) and a [Human Rights Report](#), both publicly available, which detail Meta's broader commitments to responsible business conduct, and human rights due diligence.

Meta also supports the [Oversight Board](#), an independent body that reviews select content moderation decisions and issues recommendations to Meta. The Oversight Board provides an additional layer of external accountability for Meta's content moderation practices and is available as an external appeals mechanism for users globally (see Section 7 below).

1.4 Cumulative Number of Pieces of Content and Accounts for Each Service (Ord. Art. 18(5)(i))

Table 1.4 below sets out the cumulative number of posts and accounts on each Meta service during the reporting period. These figures represent the total volume of content posted and accounts held by users in Japan, and are distinct from the enforcement actions reported elsewhere in this report.

Number of pieces of content			Number of Monthly Active Accounts		
Facebook	Instagram	Threads	Facebook	Instagram	Threads
633.5 million	4.2 billion	550.3 million	22.1 million	82.0 million	20.6 million

Specific calculation methods and data caveats:

- **Number of Pieces of Content:** The number of pieces of content in Japan represents the total number of posts published by users located in Japan during the reporting period. Cross-posts (i.e., content simultaneously shared across multiple Meta services) and reposts (i.e., re-sharing of another user's content) are excluded from this count.
- **Number of Monthly Active Accounts:** The number of monthly active accounts in Japan is calculated as the average of the monthly active users ("MAU"), during the reporting period in Japan for each of Facebook, Instagram, and Threads, measured at the end of each month during the reporting period. A "monthly active user" is defined as a registered, logged-in user who visited the applicable service (Facebook, Instagram, or Threads) via our website or a mobile device at least once during the 28-day measurement window ending on the date of measurement.
- The geographic location of users (i.e., identification of users as being "in Japan") is estimated based on a number of factors, including IP address and self-reported location. These factors may not always accurately reflect a user's actual physical location at any given time.

2. IDPA Reporting Channel

This section describes Meta's dedicated reporting channel for requests submitted under the IDPA, including: the categories of local law violations covered and the means by which users and non-users can submit reports (Section 2.1); the volume of requests received through the IDPA reporting channel during the reporting period (Section 2.2); and Meta's non-IDPA report handling processes (Section 2.3).

2.1 Local Law Violations

Pursuant to Article 22 of the IDPA, users and non-users in Japan who wish to report content that infringes their rights (such as defamation, invasion of privacy, or portrait rights) may submit a request through Meta's dedicated IDPA reporting form, accessible via <https://help.meta.com/requests/473742855795688/> (Facebook) and <https://help.meta.com/requests/1905988783530981/> (Instagram and Threads). Users can also access the form through a link displayed on the in-product reporting tools available on nearly every piece of content across Facebook, Instagram, and Threads. The form is available in Japanese and readily accessible to users and non-users.

Meta Help Center also includes general information about the IDPA and provides step-by-step guidance on how users and non-users can submit reports (see Facebook:

<https://www.facebook.com/help/1269666141338507>, Instagram and Threads: <https://help.instagram.com/628021272992192/>).

The categories of local law violations covered under the Guidelines on Article 26 of the Act on Measures Against Infringement of Rights, Etc. ("Article 26 Guidelines") are set out below. For further details regarding the categories below, see the [Article 26 Guidelines](#).

1. Right to honor (名誉権)
2. Feelings of honor (名誉感情)
3. Invasion of privacy (プライバシー)
4. Peace in private life (私生活の平穩)
5. Portrait rights (肖像権)
6. Right to one's name (氏名権)
7. Right of publicity (パブリシティ権)
8. Copyrights and neighboring rights (著作権及び著作隣接権)
9. Trademark rights (商標権)
10. Interference with Business interests (営業上の利益)

2.2 IDPA Article 23 Number of Requests Received

Each report submitted through Meta's IDPA reporting channel is assessed against Meta's Community Standards and, where relevant, applicable local law requirements.

Table 2.2 below sets out the total number of Requests received through the IDPA reporting channel during the reporting period, classified by the reason for the request as specified by the submitter at the time of submission.

Reporting reason (category)	Number of Requests Received (Ord. Art. 18(2))		
	Facebook	Instagram	Threads
Right to honor & Feelings of honor ¹	2,458	3,070	509
Invasion of privacy	1,126	1,274	323
Peace in personal life	814	897	190
Portrait rights ²	251	1,869	407
Right to one's name	652	321	15
Right of publicity	217	43	8

¹ Please note that "Right to honor" and "Feelings of honor" reporting reasons are combined in this report due to a logging issue that prevented us from differentiating between the two categories.

² Please note that Requests received are generally reported based on the location of the requestor. However, due to a logging issue, we are reporting the portrait rights category based on the location of the sender/actor(s) provided in the request.

Trademarks, Copyrights, and neighboring rights ³	1,338,662	150,211	2,607
Business interests	358	222	53
Total⁴	1,344,304	156,048	3,705

2.3 Non-IDPA Report Handling

The IDPA reporting channel is intended for Requests related to rights-infringing content as defined under the Act. When Meta receives Requests through this channel that fall outside the IDPA scope (for example, account access requests, other product support issues, or spam reports), Meta informs the reporter that the IDPA channel is not the appropriate reporting mechanism and directs the reporter to relevant Help Center resources and/or other in-product reporting pathways, as applicable.

3. Notifications to Reporter

This section describes the notifications Meta sends to reporters following the submission of a request through the IDPA reporting channel, including: decisions communicated within 7 days of receipt of the Request (Section 3.1.1); decisions communicated after 7 days (Section 3.1.2); and notifications where the request did not result in enforcement action (Section 3.1.3).

3.1 IDPA Article 25 Notifications Sent to the Reporter (Ord. Art. 18(3))

Under Article 25 of the Act, Meta is required to provide notifications to Reporters. Meta's notifications include: (a) acknowledgement of receipt of a report; and (b) notification to the Reporter of the outcome of the report, including the decision on the reported content and the reasons for that decision.

When Meta takes enforcement action on content reported through the IDPA reporting channel an email notification is sent to the reporter. This notification informs the reporter of the action taken, and the reason for that action. Similarly, when a report does not result in an action taken on reported content, the reporter is notified that their report did not result in an action taken. The number of decisions taken therefore also reflects the number of notifications sent to reporters.⁵

³ Please note that "Copyrights and neighbouring rights" and "Trademark rights" reporting reasons are combined in this report due to a logging issue that prevented us from differentiating between the two categories.

⁴ The total includes a small number (<30 total) of Requests submitted through the IDPA reporting channel during the reporting period for which the reporting reason category was not logged due to a technical issue at the time of submission. These Requests still relate to one of the ten rights infringing categories listed in the Article 26 Guidelines.

⁵ Specifically for reports concerning right to honor, feelings of honor, copyrights and neighboring rights, and trademark rights, we allow users to submit multiple pieces of content within a single report consistent with our global reporting channels for defamation and intellectual property. A single notification may be issued per report in these cases, which means enforcement figures may exceed notification figures for these categories.

3.1.1 Decisions Taken Within Seven (7) Days (Ord. Art. 18(3)(i)~(ii))

Meta monitors notification timelines for Requests submitted through the IDPA reporting channel to support compliance with the seven-day turnaround time requirement under IDPA Article 25.

Table 3.1.1 below sets out the number of Requests resolved within seven (7) days from receipt of the Request that resulted in enforcement action, classified by reporting reason for each Service. Requests that did not result in enforcement action are reported separately in Section 3.1.3 below.

Decision taken within seven (7) days from receipt of request			
Reporting reason (category)	Number of Requests that resulted in actions (Ord. Art. 18(3)(i))		
	Facebook	Instagram	Threads
Right to honor & Feelings of honor ¹	354	638	63
Invasion of privacy	203	684	97
Peace in personal life	84	272	20
Portrait rights	109	932	203
Right to one's name	72	118	1
Right of publicity	21	7	0
Trademarks, Copyrights, and neighboring rights ³	647,624	35,455	850
Business interests	33	65	6
Total⁶	648,391	37,243	1,037

Consistent with the exception provision in the second sentence of the Act and the related explanation in the Section I, 3(1) of the Guidelines, Meta did not send notifications to reporters following an enforcement action taken in connection with a request submitted through the IDPA reporting channel for reasons such as the following (Ord. Art. 18(3)(iii)):

⁶ The total includes a small number (<5 total) of Requests submitted through the IDPA reporting channel during the reporting period for which the reporting reason category was not logged due to a technical issue at the time of submission. These Requests still relate to one of the ten rights infringing categories listed in the Article 26 Guidelines.

- **Duplicate notifications:** Where Meta had previously sent a notification to the same reporter regarding a substantially similar enforcement action, an additional notification was not sent to avoid unnecessary repetition.
- **Fraudulent reports:** Notifications to the reporters of fraudulent reports could reveal sensitive information about Meta’s detection and enforcement infrastructure, as bad actors attempt to overwhelm or game Meta’s systems by submitting multiple reports on the same content.

The Ministry of Internal Affairs and Communications (“MIC”) brought to Meta’s attention one case in which the notification process did not operate as expected. Specifically, where a reporter submitted duplicative reports concerning the same piece of content, Meta’s system sent a single notification referencing the last report submitted rather than the first. Following investigation, Meta reviewed its processes and training to ensure the handling of duplicative reports and notifications is consistent with the requirements of the Act.

3.1.2 Decisions Taken after Seven (7) Days (Ord. Art. 18(3)(iv)~(v))

Table 3.1.2 below sets out the number of Requests actioned after the seven-day deadline that resulted in enforcement action, classified by reporting reason for each Service. Requests that did not result in enforcement action are reported separately in Section 3.1.3 below, as Meta is currently unable to disaggregate non-actioned Requests by response time.

Decisions taken after seven (7) days from receipt of request			
Reporting reason (category)	Number of requests that resulted in actions (Ord. Art. 18(3)(iv))		
	Facebook	Instagram	Threads
Right to honor & Feelings of honor ¹	67	436	11
Invasion of privacy	17	41	6
Peace in personal life	4	12	2
Portrait rights	25	153	25
Right to one’s name	9	5	0
Right of publicity	1	0	0
Trademarks, Copyrights, and neighboring rights ³	677	563	2
Business interests	2	8	2

Total⁷	778	1,065	23
--------------------------	------------	--------------	-----------

Meta did not identify any instance in which notification to the reporter was issued after the seven-day deadline for reasons other than specialist consultation. Therefore, Table 3.1.2 also represents the breakdown of specialist consultations in cases where action was taken beyond seven (7) days.

3.1.3 Requests Not Resulted in Action (Ord. Art. 18(3)(ii), (v))

Table 3.1.3 below sets out the total number of Requests submitted through the IDPA reporting channel that were assessed and resulted in no enforcement action, classified by reporting reason for each service.

Reporting reason (category)	Number of Requests that resulted in no actions (Ord. Art. 18(3)(iv))		
	Facebook	Instagram	Threads
Right to honor & Feelings of honor ¹	2,037	1,996	435
Invasion of privacy	906	549	220
Peace in personal life	726	613	168
Portrait rights	117	784	179
Right to one's name	571	198	14
Right of publicity	195	36	8
Trademarks, Copyrights, and neighboring rights	690,361	114,193	1,755
Business interests	323	149	45
Total⁸	695,135	117,740	2,645

Meta is currently unable to disaggregate non-actioned Requests by response time, including for specialist consultations cases. Meta is aware of this limitation and continues to explore potential solutions.

⁷ The total includes a small number (<5 total) of Requests submitted through the IDPA reporting channel during the reporting period for which the reporting reason category was not logged due to a technical issue at the time of submission. These Requests still relate to one of the ten rights categories listed in the Article 26 Guidelines.

⁸ The total includes a small number (<5 total) of Requests submitted through the IDPA reporting channel during the reporting period for which the reporting reason category was not logged due to a technical issue at the time of submission. These Requests still relate to one of the ten rights categories specified under the Act.

4. Notifications to Sender/Actor

This section describes Meta's notification practices for senders (i.e., the users who posted the content subject to a request), including: an overview of the notification framework under IDPA Article 27 (Section 4.1); notifications relating to enforcement actions taken on content (Section 4.2); notifications relating to enforcement actions taken on accounts (Section 4.3); notifications arising from reports submitted by regulators, government agencies, and law enforcement (Section 4.4); and the reasons Meta may not send notifications to senders (Section 4.5).

4.1 Notifications to the Sender/Actor under IDPA Article 27

Under Article 27 of the IDPA, Meta is required to notify the sender when enforcement action is taken on their content or account in response to a Request submitted through the IDPA reporting channel, unless a legitimate reason not to do so exists (see Section 4.5 below).

The nature of the enforcement action determines the notification issued:

- **Content removal for Community Standards violation:** Where content is determined to violate our Community Standards, the content is removed and the sender is notified via email.
- **Content restriction for local law violation:** Where content is assessed to violate applicable Japanese law but does not violate our Community Standards, Meta may restrict access to the content in Japan. The sender is notified via email.
- **Account-level enforcement:** Where an enforcement action is taken at the account level (e.g., account suspension or disabling), the sender is notified of the action taken and the basis for that action via email and/or in-product notification.

Meta's notification system is designed to ensure timely and consistent delivery of notifications to senders in accordance with the requirements of Article 27 of the IDPA. Accordingly, the number of enforcement actions reported in Tables 4.2 and 4.3 below also reflects the number of notifications issued to senders. Where notifications were not issued, the basis for the exception is detailed in Section 4.5 below.

Tables 4.2 and 4.3 below set out the number of enforcement actions taken on content and accounts, respectively, classified by violation type for each service. Actions taken on the basis of local law are reported separately from those taken for violation of our Community Standards (for further detail on the Community Standards and the classification method used, see Section 5.1 below).

4.2 Notifications to the Sender/Actor relating to Actions on Content (Ord. Art. 18(4)(i))

Table 4.2 below sets out the number of enforcement actions taken on content reported through the IDPA reporting channel, broken down by violation type for each service. The

violation types listed are illustrative of the most prevalent categories during the reporting period.

Violation Type	Number of Actions Taken on Content		
	Facebook	Instagram	Threads
Local Law Violations	11,890	3,741	342
Community Standards Violations			
Adult Nudity and Sexual Activity	73,810	249,245	48,486
Adult Sexual Exploitation	8,703	10,440	1,540
Adult Sexual Solicitation and Sexually Explicit Language	37,021	95,171	115,445
Bullying and Harassment	8,904	19,404	18,161
Child Sexual Exploitation, Abuse, and Nudity	55,620	51,907	7,966
Dangerous Organizations and Individuals	10,376	7,931	1,623
Fraud and Deception	112,817	25,229	170,905
Hateful Conduct	4,156	3,189	16,205
Human Exploitation	36,456	10,656	1,529
Intellectual Property	39,321	60,103	2,350
Restricted Goods and Services	2,285	357	642
Spam	420,954	151,519	1,059,618
Suicide and Self-Injury	11,949	66,468	3,071
Violence and Incitement	3,566	5,116	8,274
Violent and Graphic Content	584	295	69
Total (including other violations)	891,693	798,330	1,461,097

4.3 IDPA Article 27 Notifications to the Sender/Actor relating to Actions on Accounts (Ord. Art. 18(4)(i))

Table 4.3 below sets out the number of enforcement actions taken on accounts reported through the IDPA reporting channel, broken down by violation type for each service. The violation types listed are illustrative of the most prevalent categories during the reporting period.

Violation Type	Number of Actions Taken on Accounts		
	Facebook	Instagram	Threads
Local Law Violations	9	336	184
Community Standards Violations			
Account Integrity and Authentic Identity	10,883,834	3,827,805	331,704
Adult Sexual Solicitation and Sexually Explicit Language	3,271	13,898	270
Child Sexual Exploitation, Abuse, and Nudity	12,775	109,667	177
Fraud and Deception	49,801	72,014	896
Spam	152,018	513,073	1,047
Total (including other violations)	11,199,182	4,690,678	334,361

4.4 Notifications to the Sender/Actor arising from Regulators, Government Agencies, and Law Enforcement Reports

In addition to enforcement actions taken in response to Requests submitted by users and non-users through the IDPA reporting channel (Sections 4.1 and 4.2 above), Meta also takes enforcement action on content reported by regulators, government agencies, and law enforcement entities (see Section 5.3.4 below).

Where an enforcement action is taken on content as a result of a regulator, government agency, or law enforcement request, Meta sends a notification to the sender/actor in accordance with the same notification process described in Section 4.1 above. The number of notifications sent to senders therefore also reflects the number of enforcement actions taken, as reported in Section 5.3.4 below.

4.5 Reasons for Not Sending Notifications to the Sender/Actor (Ord. Art. 18(4)(ii))

Meta sends notifications to the sender/actor when an enforcement action is taken on their content. However, in certain limited circumstances, a notification may not be sent following an enforcement action taken in connection with a report submitted through the IDPA reporting channel. The circumstances in which notifications may be withheld are consistent with those recognized under the Act and Guidelines. These include:

- **Safety and risk considerations:** Meta may not send notifications where providing notice to the sender/actor could pose a risk of secondary harm, such as circumstances that could expose victims or reporters to harm.
- **Interfering with a criminal investigation:** Meta may not send notifications where this could interfere with an ongoing law enforcement investigation.
- **Exposing sensitive enforcement information:** Meta may not send notifications where doing so could expose sensitive information about Meta's content moderation infrastructure and allow bad actors to circumvent detection.

5. Meta's Content Policies / Transmission Prevention Measures

This section describes Meta's Transmission Prevention Measures, including: OurCommunity Standards, their global application, structure, and classification methodology (Section 5.1); how Meta enforces its Community Standards through detection and action on content (Section 5.2); the volume and outcomes of content-level enforcement actions, including those arising from user reports, proactive detection, government and regulator reports, and court orders (Section 5.3); and Meta's approach to account-level enforcement (Section 5.4).

Our Community Standards and other content policies set out when Meta will take Transmission Prevention Measures.

5.1 Community Standards

5.1.1 Overview

Our [Community Standards](https://transparency.meta.com/policies/improving) are developed based on feedback from people and the advice of experts in fields such as public safety, technology, and human rights. To ensure that everyone's voice is valued, Meta takes great care to create standards that take into account different views and beliefs, especially from people and communities that might otherwise be overlooked or marginalized. More information on how Meta develops, updates, and improves its policies is publicly available in Meta Transparency Center at: <https://transparency.meta.com/policies/improving>.

Our Community Standards reflect the balance between enabling free expression and maintaining a safe environment across Facebook, Instagram, and Threads. The standards define the boundaries of acceptable content and conduct across Meta's services and have evolved over more than a decade, evolving through continuous engagement with external stakeholders and in response to emerging online harms.

5.1.2 Global Application and Scope

Our Community Standards apply to everyone, all around the world, and set out the rules for what is and is not allowed on Facebook, Instagram, and Threads. They apply regardless of geography, language, or cultural context. The full text of the Community Standards is

published on the Meta Transparency Center in Japanese (as well as multiple other languages) at: <https://transparency.meta.com/policies/community-standards>.

5.1.3 Structure of the Standards

The Community Standards are organized by policy area. Each section starts with a "Policy Rationale" that sets out the aims of the policy and the nature of the potential harm it addresses, followed by detailed descriptions of the specific types of content and conduct that are subject to enforcement, including:

- Content that is not allowed and removed.
- Content that requires additional information or context before Meta can take enforcement action.
- Content that is allowed with a warning screen or content where we limit the ability to view it to users who are aged 18 and older.

This structure enables users and others to understand, by reference to specific descriptions of prohibited content, what types of enforcement actions may be taken and on what basis. For an example of how individual policies are structured, see Meta Fraud, Scams and Deceptive Practices policy available at:

<https://transparency.meta.com/policies/community-standards/fraud-and-scams/>

The Meta Transparency Center also includes a record of updates to each Community Standards policy area on its respective policy page.

5.1.4 Classification Method for Enforcement Reasons (Community Standards Taxonomy) (IDPA Article 26(4))

For regulatory reporting, Meta maps enforcement reasons to the public Community Standards categories to ensure consistency and transparency. The "reason for enforcement action" in all statistical tables in this report is aligned with our externally published Community Standards enforcement taxonomy, available at: <https://transparency.meta.com/policies/community-standards>. This mapping ensures that external regulatory reporting uses clear, standardized policy area labels that correspond to the categories used in our [Community Standards Enforcement Report](#) (see Section 9.2.1 below).

Each section of our Community Standards starts with a "Policy Rationale" that sets out the aims of the policy followed by specific policy lines that outline content that is not allowed, which function as generalized examples.

5.1.5 Other Content Policies

In addition to the Community Standards described above, Meta also maintains other content policies applicable to specific types of content on the Services:

- **Advertising Standards** govern what is and is not allowed in paid advertising on Meta's platforms. These standards impose additional restrictions on advertising content beyond those in the Community Standards, including rules on prohibited content, targeting

restrictions, and industry-specific requirements. Meta Advertising Standards are publicly available at: <https://transparency.meta.com/policies/ad-standards>.

- **Commerce Policies** apply to the sale of products and services on Meta's platforms, setting out requirements for product listings and marketplace transactions. The Commerce Policies are publicly available at: https://www.facebook.com/policies_center/commerce

5.2 How Meta enforces its Community Standards

5.2.1. How Meta detects and takes action on content (Ord. Art. 18(5)(i))

Meta employs a combination of automated detection technologies and human review to identify, assess, and take action on content and accounts that may violate our [Community Standards](#) or applicable local law requirements. For a detailed description of how Meta enforces its policies, including the tools and technologies used, see our Transparency Center at: <https://transparency.meta.com/enforcement>.

Meta's enforcement systems detect and assess potentially violating content through two primary pathways:

1. **Proactive (automated) detection:** Meta invests in AI and machine learning systems that proactively detect content that may violate its policies. The effectiveness of these systems is publicly reported through proactive detection rate metrics in Meta Community Standards Enforcement Report, available at: <https://transparency.meta.com/reports/community-standards-enforcement>. During the reporting period, Meta's global proactive detection rates exceeded 90% for many policy areas, including child sexual exploitation, dangerous organizations, and terrorism-related content. For further detail, see Section 6 below.
2. **Reports:** Users can report content they believe violates Meta's policies through in-product reporting tools available on content across Facebook, Instagram, and Threads. Meta also reviews content reported by regulators, law enforcement, government agencies, and other bodies. Reported content is reviewed against our Community Standards and, where legally required, applicable local law.

Where automated systems flag content for further assessment, trained content reviewers conduct a manual review. Meta's human review teams include reviewers with Japanese language expertise and training (see Section 8 below).

When Meta identifies a violation of its Community Standards, it may take a range of actions depending on the severity and nature of the violation. These actions include, but are not limited to: removing the content, applying warning labels, reducing the distribution of the content, and restricting or disabling the account responsible for the violation. The specific actions available and the criteria for their application are described in Meta Transparency Center at: <https://transparency.meta.com/enforcement/taking-action>.

5.3 Content-Level Enforcements

5.3.1 Number of Actions taken on content as a result of user reports (Ord. Art. 18(5)(ii))

Table 5.3.1 below sets out the number of pieces of content actioned by Meta as a result of user reports submitted by users in Japan through Meta's standard in-product reporting tools, broken down by reporting reason, which correlates with violation type⁹, for each service. The reporting reasons listed are illustrative of the most prevalent categories during the reporting period.

Reporting Reason	Number of pieces of content actioned after report		
	Facebook	Instagram	Threads
Adult Nudity and Sexual Activity	11,117	49,182	3,448
Adult Sexual Exploitation	8,464	38,001	3,643
Adult Sexual Solicitation and Sexually Explicit Language	3,592	41,927	5,294
Bullying and Harassment	4,081	14,756	11,418
Child Sexual Exploitation, Abuse, and Nudity	9,294	37,311	2,770
Dangerous Organizations and Individuals	3,875	4,050	1,810
Fraud and Deception	10,647	118,104	29,949
Hateful Conduct	5,297	10,455	21,087
Human Exploitation	727	525	109
Restricted Goods and Services	242	290	275
Spam	16	5,928	0
Suicide and Self-Injury	1,353	6,930	1,193
Violence and Incitement	3,734	5,815	7,985
Violent and Graphic Content	3,325	4,996	4,037
Total (including other violations)	67,022	377,437	94,030

⁹ While the violation type is generally expected to align with the reporting reason, because Meta reviews reported content against all Community Standards, the violation type for which content is actioned may in some cases differ from the original reporting reason.

5.3.2 Number of Non-Actions taken on content as a result of user reports (Ord. Art. 18(5)(ii))

Table 5.3.2 below sets out the number of pieces of content reported by users in Japan through Meta's standard in-product reporting tools that were assessed and determined not to violate our Community Standards or other applicable policies, and on which no enforcement action was taken, broken down by reporting reason for each service. Again, the reporting reasons listed are illustrative of the most prevalent categories during the reporting period.

Reporting Reason	Number of pieces of content reported			Number of pieces of content not actioned		
	Facebook	Instagram	Threads	Facebook	Instagram	Threads
Adult Nudity and Sexual Activity	76,796	405,752	44,826	65,679	356,570	41,378
Adult Sexual Exploitation	62,287	152,350	27,771	53,823	114,349	24,128
Adult Sexual Solicitation and Sexually Explicit Language	25,656	160,534	46,081	22,064	118,607	40,787
Bullying and Harassment	143,117	638,164	266,241	139,036	623,408	254,823
Child Sexual Exploitation, Abuse, and Nudity	45,647	154,722	20,432	36,353	117,411	17,662
Dangerous Organizations and Individuals	76,273	59,374	26,925	72,398	55,324	25,115
Fraud and Deception	105,305	698,059	221,633	94,658	579,955	191,684
Hateful Conduct	139,949	447,263	348,039	134,652	436,808	326,952
Human Exploitation	8,158	7,247	1,712	7,431	6,722	1,603
Restricted Goods and Services	8,005	17,150	4,278	7,763	16,860	4,003
Spam	2,760	263,700	8,371	2,744	257,772	0

Suicide and Self-Injury	12,948	70,168	11,264	11,595	63,238	10,071
Violence and Incitement	79,900	117,710	82,855	76,166	111,895	74,870
Violent and Graphic Content	66,212	118,097	33,455	62,887	113,101	29,418
Total (including other violations)	870,017	3,623,945	1,174,925	802,359	3,235,479	1,067,189

5.3.3 Proactive Enforcement (Ord. Art. 18(5)(iii))

This section reports on the number of cases where Meta detected and removed content through its own initiative (self-detection), without the need for a user or other report. Meta refers to this as "proactive enforcement."

Meta publicly reports on the effectiveness of its proactive enforcement through its [Community Standards Enforcement Reports](#), available on Meta Transparency Center. "Proactive rate" is defined as the percentage of content actioned for a given policy area that was detected by Meta's automated systems before a user report was made. Meta's proactive detection rates are consistently high across most policy areas globally, and Meta continues to invest in improving these rates for all languages.

For reference, Meta's publicly reported global proactive detection rates during the reporting period show rates consistently exceeding 90% for many policy areas, including child sexual exploitation, dangerous organizations, and terrorism-related content. For categories such as hate speech and bullying, proactive detection rates have been steadily improving through continued investment in AI systems, including those tailored to the Japanese language. Full global data is available in our [Community Standards Enforcement Report](#) on Meta Transparency Center.

Table 5.3.3 below sets out the number of pieces of content proactively detected and actioned in Japan during the reporting period, broken down by violation type for each service. The violation types listed are illustrative of the most prevalent categories during the reporting period.

Violation Type	Number of actions taken proactively		
	Facebook	Instagram	Threads
Adult Nudity and Sexual Activity	71,739	233,348	46,999
Adult Sexual Exploitation	7,920	8,920	1,156
Adult Sexual Solicitation and Sexually Explicit Language	33,891	70,307	108,948

Bullying and Harassment	2,182	2,656	1,408
Child Sexual Exploitation, Abuse, and Nudity	54,436	44,764	6,459
Dangerous Organizations and Individuals	9,926	7,604	1,196
Fraud and Deception	109,037	19,689	162,147
Hateful Conduct	615	574	1,410
Human Exploitation	35,699	9,761	1,323
Intellectual Property	16,231	13,131	139
Restricted Goods and Services	1,942	257	430
Spam	419,218	148,859	1,052,737
Suicide and Self-Injury	11,382	63,345	2,538
Violence and Incitement	1,508	2,725	902
Violent and Graphic Content	517	170	33
Total (including other violations)	822,163	660,882	1,390,718

5.3.4 Requests from Public Authorities (Ord. Art. 18(5)(iv)~(v))

Meta has dedicated online channels for content restriction requests from regulators, government agencies, and law enforcement.

Review Process

When Meta receives a request from a regulator, government agency, or law enforcement body to take action on content, it applies a consistent, multi-step review process. This process is applied uniformly across all jurisdictions, including Japan.

Step 1: Review Against Community Standards

Each request is first assessed against our Community Standards. If the content violates Meta's policies, it is removed from the platform globally.

Step 2: Legal review

If the content does not violate our Community Standards, Meta conducts a legal review to determine whether the requesting body has the legal authority to issue such a request, and whether the request is supported by a valid legal basis under applicable law.

Step 3: Human Rights and Due Diligence Review

If the report is not rejected at the legal review stage, Meta conducts a human rights due diligence assessment informed by our company principles, commitments as a member of the [Global Network Initiative \(GNI\)](#), and our [Corporate Human Rights Policy](#).

The due diligence assessment takes the form of a five part test: Legality, Legitimacy, Necessity, Proportionality, and External Risks. After review, we may restrict the content's availability in the country where it is alleged to be unlawful.

Step 4: Action and Reply

If Meta takes action on content based on a legal request, we will also consider whether any additional transparency and accountability measures are appropriate, such as an appeal by Meta of the takedown request, real-time transparency via a [case study on the Transparency Center](#), or sending a copy of the order to Lumen at <https://lumendatabase.org/>.

Where we do act against content on the basis of local law rather than our Community Standards, we restrict access to the content in the jurisdiction where it is alleged to be unlawful. A response is issued to the reporting regulator, government agency, or law enforcement entity, and the impacted user is also informed of the action taken.

Regulator Requests Received During the Reporting Period

The figures reported in this section reflect enforcement actions taken specifically in response to requests received from regulators, government agencies, and law enforcement entities with legal authority to request content takedown, which are onboarded to our dedicated reporting channels (generally, "regulator requests"). These figures may appear lower relative to other enforcement categories, as the contents identified in regulator requests may have already been detected and actioned through Meta's other detection methods, including proactive automated detection systems and user reports, prior to receipt of the regulator's request. Where content has already been removed or restricted through these alternative detection mechanisms, it is not counted again under this section to avoid duplication.

Regulator requests may identify both specific pieces of content and accounts. Upon review, Meta may take action at the content level (for example, removing or restricting individual posts), at the account level (which results in all associated content being removed), or on only a subset of the content / accounts identified in a request. Meta records the number of regulator requests received and whether each request resulted in enforcement action.

Table 5.3.4 below sets out the number of requests received from regulators, government agencies, and law enforcement entities during the reporting period, the number of enforcement actions taken, and the number of requests where no action was taken, broken down by reporting reason and requesting agency for each service.

Reporting reason (Reporting entity)	Requests	Number of actions taken on content / accounts ¹⁰	No action taken
--	----------	--	-----------------

¹⁰ For Table 5.3.4, Meta is currently unable to disaggregate requests received from regulators, government agencies, and law enforcement entities by actions on content and actions on accounts. Meta is aware of this limitation and continues to explore potential solutions.

		Facebook	Instagram	Threads	Facebook	Instagram	Threads
Gambling and F&S etc. (National Police Agency (NPA))	1,216	40	118	359	16	161	279
Unlicensed Money Lending, Illegal Regulated Services etc. (Financial Services Agency (FSA))	5	0	51	0	0	9	0
Human exploitation, Discrimination, Bullying and Harassment etc. (Ministry of Justice (MoJ))	10	3	10	2	0	4	0

5.3.5 Court Ordered Content Actions (Ord. Art. 18(5)(vi)~(vii))

Court-ordered content actions are enforcement actions taken in response to final and binding decisions¹¹ issued by a Japanese court requiring Meta to take action against specific content. These are distinct from the regulator, government agency, and law enforcement entity requests reported in Section 5.3.4 above, which originate from non-judicial public institutions.

Table 5.3.5 below sets out the number of court orders received and the number of pieces of content removed in response to such court orders during the reporting period, broken down by reason for petition, for each service.

Reason for Petition	Number of court orders received			Number of pieces of content removed in response to a court order		
	Facebook	Instagram	Threads	Facebook	Instagram	Threads
None received	0	0	0	0	0	0

5.4 Account-Level Enforcement (Ord. Art. 18(5)(viii))

5.4.1 How we measure actions on Accounts

Meta may determine that an account violates our Community Standards based on specific content or behavior. If we disable an account, all of the content within it automatically becomes inaccessible.

¹¹ Final and binding decisions do not include provisional orders.

Metrics reported in the [Community Standards Enforcement Report](#) count only content within accounts that was individually reviewed and actioned as violating our policies. Content that becomes inaccessible solely as a consequence of an account being disabled is not counted in these metrics.

5.4.2 How Meta detects and takes action on content

Meta's account-level enforcement framework is designed to be proportionate to the severity of the policy violation and the risk of harm posed to the community. Enforcement actions escalate progressively based on the number and severity of violations.

Restricting accounts

Meta operates a strikes-based system for account-level enforcement. For most violations, a first strike results in a warning with no further restrictions. Subsequent strikes result in restrictions from specific features (such as posting, commenting, creating ads, or using certain platform features) for progressively longer periods:

- One strike: warning with no further restrictions
- Two to six strikes: restriction from specific features for a limited time
- Seven strikes: one-day restriction from creating content
- Eight strikes: three-day restriction from creating content
- Nine strikes: seven-day restriction from creating content
- Ten or more strikes: 30-day restriction from creating content

For violations of more severe policies (such as dangerous individuals and organizations or adult sexual exploitation), additional longer restrictions from certain features may be applied on top of the standard restrictions, starting from the first strike.

Meta notifies users when content is removed or restrictions are applied to their account. Users can view their history of violations and any active restrictions through Account Status on Facebook, Instagram and Threads.

Further information is available at:

<https://transparency.meta.com/enforcement/taking-action/restricting-accounts/>.

Disabling accounts

For persistent or severe violations, Meta may disable an account entirely. If a user continues to post content that goes against the Community Standards despite repeated warnings and restrictions, Meta will disable their account. After five strikes, a user may receive additional 30-day restrictions or have their account removed, depending on the severity and frequency of violations.

In some cases, a violation may be severe enough that Meta will disable an account after one occurrence, such as posting child sexual exploitation content.

If an account is disabled, the user is notified and informed whether they can request a review. Meta's enforcement decisions are generally subject to appeal (see Section 7 below), and if Meta determines that a mistake was made, the content is restored and the strike and restriction are removed.

Further information is available at:

<https://transparency.meta.com/enforcement/taking-action/disabling-accounts/>.

During the reporting period, Meta suspended over 11.1 million accounts on Facebook, 4.69 million on Instagram, and 334k on Threads held by users in Japan. Tables 5.4.2.1 - 5.4.2.3 below provide a breakdown of account-level enforcement actions by suspension reason (mapped to Community Standards categories) and by how the violation was detected (proactive; user report; regulator, government agency, or law enforcement entity report; or court order), for each service. The violation types listed are illustrative of the most prevalent categories during the reporting period.

Facebook				
Suspension Reason (Community Standards category)	Proactive action	Report based action	Regulator reports	Court-Ordered
Account Integrity and Authentic Identity	10,837,873	45,961	2	0
Adult Sexual Solicitation and Sexually Explicit Language	1,782	1,489	0	0
Child Sexual Exploitation, Abuse, and Nudity	9,931	2,844	0	0
Fraud and Deception	39,528	10,273	4	0
Spam	122,504	29,514	0	0
Total Suspensions	11,091,862	107,312	6	0

Facebook				
Suspension Reason (Community Standards category)	Proactive action	Report based action	Regulator reports	Court-Ordered
(including other violations)				

Instagram				
Suspension Reason (Community Standards Category)	Proactive action	Report based action	Regulator reports	Court- Ordered
Account Integrity and Authentic Identity	3,634,421	193,384	24	0
Adult Sexual Solicitation and Sexually Explicit Language	5,921	7,977	0	0
Child Sexual Exploitation, Abuse, and Nudity	78,275	31,392	0	0

Total Suspensions	320,197	13,974	15	0

6. Automated Systems

This section describes Meta's use of automated systems in content enforcement, including: the AI and machine learning technologies Meta deploys to help detect, assess, and take action on potentially violating content and accounts (Section 6.1); and the volume of enforcement actions assisted by automated systems during the reporting period (Section 6.2).

6.1 AI and Automated Enforcement Systems

Meta invests in artificial intelligence ("AI") and machine learning technologies to help proactively detect, assess, and take action on content and accounts that may violate its [Community Standards](#). These automated systems are a core component of our content moderation infrastructure and are designed to operate at the scale required to address the volume of content shared globally across Facebook, Instagram, and Threads,

Meta's automated enforcement systems perform several key functions:

1. **Proactive detection:** In addition to reviewing user reports, Meta also uses AI systems to proactively detect content that may violate its policies. Meta publicly reports on the effectiveness of these systems through "proactive rate" metrics in its [Community Standards Enforcement Report](#). The proactive rate represents the percentage of content actioned for a given policy area that was detected by Meta's automated systems before any user report was made. During the reporting period, Meta's global proactive detection rates exceeded 90% for many policy areas, including child sexual exploitation, dangerous organizations, and terrorism-related content.
2. **Classification and prioritization:** Automated systems help classify reported and detected content by violation type and severity, enabling Meta to prioritize the most harmful content for expedited review and action.
3. **Language-specific capabilities:** Meta continues to invest in expanding the language capabilities of its AI systems, including for Japanese. This continued investment supports the detection of policy-violating content in Japanese across all three Services.
4. **Bot and inauthentic behavior detection:** Meta deploys detection technology to identify automated accounts ("bots") and coordinated inauthentic behavior that may also be used to distribute violating content. These systems complement Meta's broader efforts to maintain the integrity of the Services.

For further information on how Meta uses technology in its enforcement approach, see the Meta Transparency Center at:

<https://transparency.meta.com/enforcement/detecting-violations>.

6.2 AI-Assisted Actions (Ord. Art. 18(5)(ix), (x))

Meta employs a combination of automated detection technologies and human review to identify and take action on content and accounts that may violate its policies. As such, enforcement actions described in this report reflect a combination of these mechanisms working together as a system - for example:

- **Proactive detection:** Content and accounts proactively detected and actioned by Meta's automated systems (for AI-assisted actions on content, see Table 5.3.3 above; for accounts, see Tables 5.4.2.1 - 5.4.2.3 above).
- **Report-based detection:** Content and accounts reported by users and other bodies through reporting channels such as Meta's in-app reporting tools or through the IDPA reporting channel, and subsequently actioned (for AI-assisted actions on content, see Table 5.3.1 above; for accounts, see Tables 5.4.2.1 - 5.4.2.3 above).

People remain central to this approach, with experts guiding AI and automated systems, supporting the review of content and accounts, and handling the most complex decisions. For further information on how Meta is deploying more advanced AI systems while keeping people at the center of its content enforcement, see:

<https://about.fb.com/news/2026/03/boosting-your-support-and-safety-on-metas-apps-with-ai/>.

7. Appeals (Ord. Art. 18(5)(xi)~(xvii))

This section describes the appeals mechanisms available to users in Japan, including: Meta's internal appeals process for content and account enforcement decisions, and the volume and outcomes of appeals during the reporting period, including a breakdown of appeals against decisions made using AI systems (Section 7.1); and the external appeals mechanism available through the Oversight Board (Section 7.2).

7.1 Content and Account Appeals

Meta offers appeals for the vast majority of Community Standards violation types on Facebook, Instagram and Threads. For example:

- If content is found to not go against our Community Standards, the individual or entity that submitted the report can request a review of that decision.
- If content is actioned for going against our Community Standards, the user that posted that piece of content can request a review of the decision.

Meta informs the parties about the outcome of their appeal.

Meta publicly reports on global appeal volumes and overturn rates in its [Community Standards Enforcement Report](#), which includes data on appealed content, restored content, and the proportion of original decisions that were reversed upon appeal.

Table 7.1 below sets out the volume of appeals submitted by users in Japan against policy violation enforcement actions on content and accounts during the reporting period, including a breakdown of appeals against decisions made using AI systems, as well as the number of appeals that resulted in a reversal of the original decision.

Appeal Type	Count		
	Facebook	Instagram	Threads
Total number of appeals against content enforcement decisions (Ord. Art. 18(5)(xi))	54,682	70,297	44,489
Number of appeals against content enforcement decisions using AI systems (Ord. Art. 18(5)(xii))	25,856	56,200	43,279
Total number of appeals that resulted in a reversal of the original content enforcement decision (Ord. Art. 18(5)(xiii))	18,485	25,345	14,479

Appeal Type	Count		
	Facebook	Instagram	Threads
Number of appeals that resulted in a reversal of the content enforcement decision, where the original decision was actioned using AI systems (Ord. Art. 18(5)(xiv))	10,189	18,380	13,827
Total number of appeals against account enforcement decisions (Ord. Art. 18(5)(xv))	517,981	1,379,466	223,881
Number of appeals against account enforcement decisions using AI systems (Ord. Art. 18(5)(xvi))	499,504	1,298,216	219,402
Total number of appeals that resulted in a reversal of the original account enforcement decision (Ord. Art. 18(5)(xvii))	127,713	548,463	139,175
Number of appeals that resulted in a reversal of the original account enforcement decision, where the original decision was actioned using AI systems (Ord. Art. 18(5)(xviii))	121,411	515,660	138,118

7.2 External Appeals: The Oversight Board

Users may also appeal content enforcement decisions to the [Oversight Board](#) after exhausting Meta’s internal appeal review system. The Oversight Board is an independent body, separate from Meta, that was established to review selected content enforcement decisions made by Meta. The Board's mission is to examine whether Meta’s original content decision is consistent with its public-facing Community Standards, core values, and human rights commitments.

- Independent review:** The Oversight Board independently selects and reviews cases from user appeals of Meta’s content decisions or from cases directly referred by Meta. The Board’s individual case decisions are binding on Meta. Users may also appeal enforcement decisions made on content they posted or reported to the Oversight Board. If selected, the Board will decide whether to overturn or uphold Meta’s original decision, and case decisions are publicly available at: <https://www.oversightboard.com/decision/>.
- Policy recommendations:** In addition to their binding decisions on individual pieces of content, the Oversight Board may issue non-binding recommendations to Meta on its broader content moderation practices. These recommendations can be made in cases or in standalone policy advisory opinions on specific issues. Meta is committed to responding

publicly to these recommendations. The Board's recommendations, Meta's public responses, and Meta's progress on recommendations are available here:

<https://transparency.meta.com/oversight/oversight-board-recommendations/>.

- **Transparency reporting:** The Oversight Board publishes its own transparency reports detailing case volumes, decision outcomes, and Meta's implementation of its recommendations. These reports are available at: <https://transparency.meta.com/oversight/meta-biannual-updates-on-the-oversight-board/> and <https://www.oversightboard.com/news/>.

8. Transmission Prevention Measures: Infrastructure and Resources

This section describes Meta's infrastructure and resources for implementing Transmission Prevention Measures, including: the specialists nominated by Meta for each designated platform (Section 8.1); the AI and human review capabilities Meta deploys for Japanese-language content enforcement (Section 8.2.1); the measures Meta takes to maintain accuracy (Section 8.2.2); and the training and support provided to reviewers (Section 8.2.3).

8.1 Specialist Expertise and Training (Ord. Art. 18(5)(xix))

Specialists assist Meta in determining whether the distribution of reported content constitutes an infringement of a reporter's rights, taking into account the rights and interests of both the reporter and the sender/actor. This determination requires the application of specialized legal knowledge, including an understanding of how Japanese courts have interpreted the scope of rights such as defamation, privacy, portrait rights, and other covered rights in the context of online expression.

The specialists Meta has selected are individuals with expertise in Japanese law, including knowledge of relevant statutes, court precedent, and legal standards applicable to determinations of rights infringement in the online context. They also possess familiarity with social and cultural matters relevant to such determinations in Japan.

Specialists maintain their expertise through ongoing review of legal developments, regular engagement with other Japanese legal practitioners, and periodic training on updates to relevant laws and judicial interpretation.

Table 8.1 below sets out the specialists nominated by Meta for the implementation of Transmission Prevention Measures on each designated platform in Japan.

Facebook	Instagram	Threads
Jun Usami	Shinsuke Yakura	Toshio Dokei
Each nominated specialist is a senior Japanese lawyer with long-term experience advising on legal issues related to designated platforms, and possesses deep knowledge of the relevant services and applicable laws.		

The nominated specialists above bring professional qualifications in Japanese law and practical experience relevant to online rights disputes. The involvement of these specialists, when required, ensures complex cases involving potentially competing rights can receive thorough legal analysis.

8.2 Human and Technical Measures for Implementing Transmission Prevention Measures, including Training and Expertise (Ord. Art. 18(5)(xx)–(xxi))

8.2.1 Reviewer Expertise and Training

Meta maintains specialized teams with deep expertise in applying its Community Standards and policies, including reviewers with expertise in Japanese customs and society (such as cultural norms relating to discrimination, honor and privacy) and familiarity with Japanese legal requirements.

Where appropriate, content reported in Japanese is routed to reviewers with Japanese-language proficiency, supporting the assessment of the content with local context. These reviewers bring familiarity with Japanese-language nuance, cultural references, and local context that may be relevant to applying our Community Standards.

Meta designs and implements policy training for reviewers handling content moderation, including content reported through the IDPA reporting channel. Training includes guidance on policy violations, illustrative examples, and the rationale underpinning each policy.

Reviewers undergo a structured onboarding training programme and receive regular ongoing coaching to ensure they have a strong grasp of Meta's policies, the rationale behind those policies, and how to apply them accurately.

Meta monitors reviewer performance on an ongoing basis through quality evaluations to help ensure content is being assessed accurately against applicable policies.

8.2.2 Technical Measures and AI-Augmented Content Enforcement

Meta's general approach to detecting and enforcing policy-violating content is described in Section 5.2.1 above. This section addresses the specific AI capabilities relevant to Japanese language coverage.

Meta deploys advanced AI systems that cover languages spoken by approximately 98% of people online, significantly expanding on previous coverage of around 80 languages. These systems can increase enforcement capacity in any language based on need, and are designed to adapt to understand linguistic and cultural nuance, including niche subcultures, rapidly evolving and regionally-specific terminology, emoji meanings, and slang.

While Meta's AI systems handle detection and initial assessment at scale, certain categories of content and decisions require human oversight due to their complexity, sensitivity, or severity:

- **Emergency and crisis:** Meta maintains Emergency Escalation processes and Incident Response Teams. Global teams operate 24/7 across time zones and crisis protocols enable rapid scaling of expertise and capacity.
- **Appeals and high-impact cases:** Users can appeal enforcement decisions via in-product flows (see Section 7 above). People will continue to play a key role in how we make the highest-risk and most critical decisions, such as appeals of account disablement.
- **Child safety:** While advanced AI systems can assist in detection and escalation, Meta uses specialized trained child safety reviewers to help make final determinations about what content is reported.
- **High-severity and complex content:** For some of our most severe policy violations (e.g., credible threats of violence) or ambiguous and novel violation types, Meta uses multi-stage review, escalating key decisions to specialized expert reviewers.

For further information on how Meta is deploying more advanced AI systems while maintaining human oversight of its content enforcement, see:

<https://about.fb.com/news/2026/03/boosting-your-support-and-safety-on-metas-apps-with-ai/>.

8.2.3 Quality Assurance and Measures to Improve Accuracy (Ord. Art. 18(5)(xxi)(c))

Meta monitors, audits, and refines the quality of its content moderation infrastructure, both automated and human, to ensure that accuracy and precision remain high. These processes help identify where errors occur and inform targeted improvements to training and systems to improve the accuracy of enforcement decisions. Key measures include:

- **Quality auditing:** Meta samples and re-reviews decisions made by both human reviewers and automated systems.
- **Appeals as a feedback mechanism:** Appeal outcomes (including overturn rates and patterns) are monitored and used to improve both automated and human content moderation.
- **Over-enforcement monitoring:** Meta monitors enforcement action rates, error rates, appeal rates, and overturn rates regardless of whether the original decision was made by a human or an automated system.
- **Continuous calibration:** Meta continuously refines both its automated systems and reviewer processes to maintain accuracy.
- **External consultation:** Meta's policies, which govern what both human reviewers and AI systems enforce against, are informed by engagement with external stakeholders globally, including human rights experts, civil society organizations, and government bodies. This ensures that Meta's content standards remain current and are informed by evolving societal norms and expectations.

Meta publicly reports on enforcement accuracy in its [Community Standards Enforcement Reports](#).

9. Policy Updates

This section describes changes to Meta's content policies during the reporting period and Meta's public reporting on content enforcement, including: updates made to the Community Standards during the reporting period (Section 9.1); and the transparency reports Meta publishes on its enforcement activities, including the Community Standards Enforcement Report, the Content Restrictions Report, and the Widely Viewed Content Report (Section 9.2).

9.1 Changes to the Community Standards

9.1.1 Policy Updates During Reporting Period (Ord. Art. 18(5)(xxii))

As explained at Section 5.1 above, Meta maintains a set of globally applicable content policies, including its Community Standards, that define what is and is not allowed on its Services.

Meta regularly reviews and updates its Community Standards to ensure they remain clear, effective, and responsive to the evolving online environment. This reflects Meta's ongoing commitment to continuous policy improvement, which is informed by a range of factors including:

- Inputs from external stakeholders, civil society organizations, and subject matter experts;
- Internal review and analysis of enforcement trends and outcomes; and
- Recommendations from the Oversight Board.

When policy changes are made, Meta's automated detection systems and human reviewer teams are retrained to implement the updated standards, ensuring that enforcement remains aligned with current policy.

Meta publishes updates of the changes it makes to the Community Standards on the [Meta Transparency Center](#). A record of updates to each policy area is maintained on the respective policy page.

During the reporting period, Meta did not modify its Community Standards (i.e., its Transmission Prevention Measures standard within the meaning of the IDPA) in response to any "emergency" Transmission Prevention Measures as a result of an IDPA report.

However, during the reporting period Meta made a number of changes to its Community Standards. These include the [Inauthentic Behavior](#) policy which was updated on December 11, 2025 and the [Suicide, Self-Injury, and Eating Disorders](#) policy which was updated on February 27, 2026. These changes were made as part of Meta's ongoing policy development process. Meta did not make any changes to its Community Standards in response to Reports received through the IPDA reporting channel.

9.2 Reports (Ord. Art. 18(5)(xxiii))

9.2.1 Community Standards Enforcement Report

Meta publishes a semi-annual [Community Standards Enforcement Report](#) providing comprehensive global data on how Meta enforces its Community Standards.

The Community Standards Enforcement Report covers the following policy areas, which are consistent with the violation categories used throughout this transparency report: Adult Nudity and Sexual Activity, Bullying and Harassment, Child Sexual Exploitation Abuse and Nudity, Dangerous Organizations (Individuals and Organizations), Hate Speech, Regulated Goods (Restricted Goods and Services), Spam, Suicide and Self-Injury, Violence and Incitement, and Violent and Graphic Content, among others. For each area, the report provides metrics on the volume of content actioned, the proactive detection rate (reflecting the proportion of violations identified by Meta's AI systems before a user report), and prevalence (an estimate of how frequently users encounter policy-violating content). It also reports on appeals submitted by users against enforcement actions and the volume of content subsequently restored.

During the reporting period, Meta published Community Standards enforcement data via the Transparency Center's Integrity reports and the Community Standards Enforcement Report:

- [Q2 2025 Integrity Reports](#) (published August 2025) covering April to June 2025, including Community Standards Enforcement Report data for the quarter
- [Q3 2025 Integrity Reports](#) (published December 2025) covering July to September 2025, including Community Standards Enforcement Report data for the quarter
- [H2 2025 Community Standards Enforcement Report](#) (published March 2026) covering October to December 2025 (Q4 2025).

The global data in the Community Standards Enforcement Report provides important context for the Japan-specific data presented in Sections 5 and 6 above.

9.2.2 Content Restrictions Report

Meta publishes a bi-annual Content Restrictions Report, which provides country-level data on content that Meta has restricted access to in a jurisdiction in response to reports alleging illegality under local law. These reports can originate from government authorities, regulators, law enforcement, and courts, as well as from non-government entities and members of the public (where legally required). The report covers content that does not violate our Community Standards but was restricted on the basis of local law, and includes details such as the applicable legal grounds and type of content that was restricted. This report is available at <https://transparency.meta.com/reports/content-restrictions/>.

The Content Restrictions Report includes data on content restricted in Japan during the reporting period, and provides additional transparency into how Meta responds to reports of locally unlawful content under local legal frameworks.

9.2.3 Additional Public Reports

Meta also publishes the following reports, which are relevant to its content enforcement practices:

- **Intellectual Property Enforcement Report:** Provides data on Meta's enforcement of intellectual property rights, including copyright and trademark-related actions. Available at: <https://transparency.meta.com/reports/intellectual-property>. This report is relevant to the reporting categories of "Copyrights and neighboring rights" and "Trademark rights" in Sections 2 and 3 above.
- **Responsible Business Practices Report:** Details Meta's broader commitments to responsible business conduct, including content moderator wellbeing, AI safety, and human rights due diligence. Available at: <https://investor.atmeta.com/responsible-business-resources/default.aspx>.
- **Human Rights Report:** Describes Meta's approach to human rights due diligence, including in the context of content moderation and government requests. Available at: <https://investor.atmeta.com/responsible-business-resources/default.aspx>.

These reports are publicly available and together with this report, they reflect Meta's commitment to providing comprehensive transparency into its content enforcement practices across all jurisdictions, including Japan.

10. Self-Assessment

This section sets out Meta's self-assessment for the Services in Japan, including an evaluation of: the user reporting mechanism (Section 10.2.1); the implementation status (Section 10.2.2); any systematic issues identified in notification practices and how they were addressed (Section 10.2.3); human and technical resources for content moderation decisions in Japan (Section 10.2.4); Meta's Community Standards as a basis for content moderation decisions (Section 10.2.5); Meta's enforcement practices in relation to Japanese accounts (Section 10.2.6); the prevalence of policy-violating and illegal content on the Services (Section 10.2.7); and Meta's continued efforts to improve (Section 10.3).

10.1 Overview of Self-Assessment and Self-Assessment Standards (Ord. Art. 18(6) and 18(7))

This section presents Meta's self-assessment of its content moderation systems and policies for the Services, conducted in accordance with Article 28(5) of the IDPA and the standards and evaluation criteria published by MIC. The self-assessment covers the seven areas prescribed under Article 18(6) of the Ordinance corresponding to Sections 10.2.1 through 10.2.7 below. The seven Article 18(6) areas provide a standard against which platforms may self-assess their operations. Please see Meta's Article 18(7) self-assessment standards under each of these areas below.

10.2 Evaluation Outcomes

10.2.1 IDPA Reporting Channel (Ord. Art. 18(6)(i))

Under Article 18(6)(i) of the Ordinance, Meta is required to assess its method for users and non-users to file a request pursuant to Article 22(1) of the IDPA. Meta assesses this based on the criteria of (i) accessibility, (ii) ease of use, and (iii) utilization.

Accessibility

As explained at Section 2 above, users and non-users in Japan who wish to report content that infringes their rights (such as defamation, invasion of privacy, or portrait rights) may submit a request through Meta's dedicated IDPA reporting form. The form is accessible in Japanese and is accessible to both users and non-users through the following entry points:

- Facebook reporting form: <https://help.meta.com/requests/473742855795688/>
- Instagram and Threads reporting form: <https://help.meta.com/requests/1905988783530981/>
- In-product reporting tools available on nearly every piece of content across Facebook, Instagram, and Threads, which link directly to the IDPA reporting form
- Help Center articles: Facebook (<https://www.facebook.com/help/1269666141338507>) and Instagram and Threads (<https://help.instagram.com/628021272992192/>).

Based on the multiple entry points described above, Meta considers its IDPA reporting channel to be readily accessible to users and non-users in Japan consistent with the requirements of the Act.

Ease of use

The IDPA-specific form, available in both Japanese and English, was developed with ease of use as a primary design requirement. The form guides reporters through the submission process with clear questions and prompts, and the accompanying Help Center guidance informs reporters about what they should expect after submission (for example, that they will receive a confirmation and may be contacted for further information in certain situations).

Meta further refined the usability of the form during the reporting period in response to observed reporting trends. These refinements included improvements in the handling of low-quality reports such as spam, clearer guidance on the information users and non-users should provide to substantiate their reports, and the redirection of reporters whose submissions fall outside the scope of the IDPA to appropriate Help Center resources. These changes have helped support the ease of use of the reporting mechanism, as well as ensure that the reporting channel is maintained for its intended purpose, and that reports can be processed efficiently.

On this basis, Meta assesses that the IDPA reporting form is easy to use, and that the iterative refinements made during the reporting period have further improved both usability and the quality of information provided by reporters.

Utilization

During the reporting period, Meta received over 1.5 million requests through the IDPA reporting channel (see Section 2.1 above). Reporting volumes were sustained throughout the eight-month reporting period, indicating consistent awareness and use of the channel by persons in Japan. This sustained level of utilization supports Meta's assessment that the channel is accessible and easy to use.

10.2.2 Implementation Status of Infringing Information Transmission Prevention Measures (Ord. Art. 18(6)(ii))

Under Article 18(6)(ii) of the Ordinance, Meta is required to assess the implementation status of Transmission Prevention Measures on the claimed rights-infringing content. Meta assesses this based on the criteria of (i) operational readiness, (ii) effectiveness of outcomes, and (iii) timeliness of outcomes.

Operational readiness

Meta's IDPA workflow was operational throughout the reporting period. Meta employs a combination of technology and human review to assess reported content against Meta's Community Standards and applicable local law requirements. Meta continues to invest in expanding the capability of its detection and enforcement systems, which are designed to operate at scale.

Meta maintains internal incident monitoring and response processes to detect and remediate any systematic issues affecting its IDPA compliance workflows. Meta uses insights from any identified issues to iterate on its systems, internal processes, and user-facing communications.

During the reporting period, MIC brought to Meta's attention an instance in which duplicative reports concerning the same piece of content were not processed in their order of submission. Meta promptly investigated, reviewed the relevant processes and reviewer training, and implemented corrective measures to ensure that the handling of duplicative reports is consistent with the requirements of the IDPA.

Effectiveness of outcomes

Meta assesses that its content enforcement systems for IDPA requests produced effective outcomes during the reporting period. Where requests resulted in no action, this was because the reported content did not violate our Community Standards or applicable local law after assessment.

During the reporting period, Meta made targeted improvements to enhance the quality of review outcomes. These include expanded review guidance and putting in place processes to assess certain IDPA-reported categories more holistically - for example, where reported

content potentially infringes portrait rights under the IDPA (a common reporting category from Japanese users and non-users). As a result, a greater proportion of reports were resolved without the need for specialist escalation, demonstrating both improved review quality and more effective use of specialist resources.

Timeliness of outcomes

Meta monitors the timeliness of actions taken on requests submitted through the IDPA reporting channel to support compliance with the seven-day requirement under Article 25. During the reporting period, 45.7% of IDPA requests were actioned within seven days of receipt. For requests that exceeded the seven-day period, the basis for exceeding the statutory timeframe is detailed in Section 3.1.2 above.

Where determinations were communicated to reporters after the seven-day period, the additional time was attributable to specialist review of complex matters — for example, balancing competing rights, contextual judgements under Japanese law, or assessing the scope of the asserted right. Meta considers this additional time appropriate given the legal interests at stake.

Meta also made targeted process improvements to support the filtering of out of scope or spam reports which further supported the timeliness of overall report outcomes.

Meta assesses the timeliness of its content moderation outcomes as appropriate, and will continue to monitor and refine its processes in future reporting periods.

10.2.3 Effectiveness of Notifications(Ord. Art. 18(6)(iii))

Under Article 18(6)(iii) of the Ordinance, Meta is required to assess whether (i) the reasons prescribed in Article 25(1)(ii) of the IDPA, (ii) the compelling reason prescribed in Article 25(2)(iii) of the IDPA, and (iii) the reason prescribed in the first sentence of the main clause of Article 27 of the IDPA are “individual and specific”. Meta assesses each of these in turn below.

Reasons prescribed in Article 25(1)(ii) of the IDPA

Under Article 25(1)(ii) of the IDPA, Meta is required to provide notice to reporters if Transmission Prevention Measures are not taken on the claimed rights-infringing content, and the reason for taking no action.

Meta notifies reporters by email at the conclusion of its review. Based on its experience processing rights requests under the IDPA, Meta has developed individualized situation-specific responses for different report outcomes. These are continuously refined as new patterns are identified, ensuring each notice clearly articulates the basis for the outcome in relation to the reporter’s Request.

Where Transmission Prevention Measures are taken, the notifications provided to reporters and senders/actors identify the type of Transmission Prevention Measures implemented and the basis for such action.

Where Transmission Prevention Measures are not taken, the notifications provided to reporters fall into three principal categories:

1. Content does not violate Meta's policies or local law: The reporter is informed that Meta has carefully reviewed the report and that the reported content did not violate Meta's policies or local laws at the time of investigation.
2. Additional information required: Where Meta is unable to action a request because of insufficient information (for example, missing or invalid URLs, reports that do not sufficiently identify which element or portion of the content is alleged to be infringing, or proof of representation), the reporter is notified of the specific information required, the reason it is necessary, and the consequence if the required information is not provided (i.e., Meta is unable to process the report). For example, for portrait rights reports specifically, reporters may be asked to provide verification of their identity or confirm which individual depicted in the reported content is the reporter (or a person they are authorized to represent), where this is necessary for Meta to assess whether the reported content infringes the asserted right.
3. Request out of scope: Where a report concerns content or issues outside the scope of the IDPA reporting channel (for example, account access issues), the reporter is notified and redirected to the appropriate Help Center resource for that issue type.

In addition, where a determination requires further time for specialist review, Meta sends a response to the reporter informing them that consultation with specialist teams is underway (see Article 25(2)(ii) discussion below).

Meta assesses that the reasons communicated to reporters under Article 25(1)(ii) of the IDPA are individual and specific, identifying the outcome of Meta's review and the basis for that determination in each case.

Compelling reason prescribed in Article 25(2)(iii) of the IDPA

Under Article 25(2) of the IDPA, Meta may exceed the seven-day period where it assesses it needs to hear the opinion of the Sender (Article 25(2)(i)), have a Specialist conduct the investigation (Article 25(2)(ii)), or where there is another compelling reason (Article 25(2)(iii)).

During the reporting period, Meta did not identify any instance in which notification to the reporter was issued after the seven-day deadline for reasons other than specialist consultation under Article 25(2)(ii) (see Section 3.1.2 above). In these cases, Meta sends a response to the reporter informing them that consultation with specialist teams is underway (see Article 25(1)(ii) discussion above).

Meta assesses that the reasons communicated to reporters under Article 25(2)(ii) of the IDPA are individual and specific, identifying the need for more time to consult a specialist in each case.

Reason prescribed in the first sentence of the main clause of Article 27 of the IDPA

Under Article 27 of the IDPA, when Meta takes Transmission Prevention Measures against content, it must notify the sender/actor that such measures were taken and the reason for taking such measures.

Meta provides notifications to senders/actors when enforcement action is taken on their content or account. The form and content of the notification depends on the basis for the enforcement action:

- Content removed for a Community Standards violation: Where content is removed because it violates our Community Standards, the sender/actor receives a notification identifying the specific Community Standard that was violated (for example, bullying and harassment, violence and incitement, or hate speech). The notification is sent in the sender/actor's chosen app language, including Japanese.
- Content restricted for a local law violation: Where content is not found to violate our Community Standards but is assessed to be unlawful under Japanese law following an IDPA report, Meta will generally restrict access to the content in Japan. In such cases, the sender/actor is notified by email that access to their content has been restricted in the relevant jurisdiction based on a third-party report that the content violates local law. The notification identifies the specific content that has been restricted.
- Account-level enforcement (Service Suspension Measures): Where a sender/actor's account is subject to account-level restrictions as a result of repeated or severe violations of our Community Standards, the sender/actor is notified of the restriction, the reason for the action, and the duration of the restriction (where applicable). Account-level measures include feature restrictions (such as the inability to post or comment for a specified period), temporary suspension, and permanent disablement. Where an account is permanently disabled, the sender/actor is notified of the disablement and the reason.

Meta assesses that its notifications to senders/actors under Article 27 of the IDPA are individual and specific. Each notification identifies the content or account that has been actioned, the measure taken (removal, geo-restriction, or account-level restriction), and the reason for the action — whether a specific Community Standards violation, an assessment of illegality under local law, or account-level enforcement.

10.2.4 Personnel and Technical Measures relating to Transmission Prevention Measures (Ord. Art. 18(6)(iv))

In accordance with Article 18(6)(iv) of the Ordinance, Meta is required to assess the human and technical measures in place for implementing Transmission Prevention Measures. Meta assesses this based on the criteria of (i) sufficiency, (ii) capability, and (iii) effectiveness.

Sufficiency

As described in Section 8 above, Meta operates a content moderation system that combines (i) detection and enforcement technological systems, (ii) specialist review teams, including Japanese-language proficiency and familiarity with Japanese cultural and social context, and (iii) subject-matter legal experts with expertise in Japanese law, including Meta's nominated specialists under Article 24(1) of the Act .

Meta monitors reporting and turnaround times on an ongoing basis, and assesses that its content moderation resourcing was sufficient during the reporting period to handle the volume of content requiring review in Japan.

Capability

Meta's content moderation systems are underpinned by significant and continuing investment. As described in Sections 5.2 and 8.2 above, Meta's key technical and personnel measures include:

- Automated detection systems: Meta deploys AI-based classifiers designed to proactively identify potentially policy-violating content before it is reported. During the reporting period, the majority of content-level enforcement actions on Meta's platforms were initiated through proactive detection, exceeding 90% in many measured policy areas (see [Community Standards Enforcement Report](#)).
- Advanced AI language capabilities: Meta is deploying more advanced AI systems with Japanese language capabilities that complement Meta's review teams by supporting accurate and culturally nuanced enforcement decisions efficiently and at scale (see Section 8.2 above for further detail).
- Reviewer support tools: Meta equips review teams with ongoing training and decision support tools to support accuracy and consistency across enforcement decisions.
- Quality assurance: Meta maintains quality assurance processes to monitor the accuracy and consistency of content moderation decisions, and uses insights from these processes to make improvements to reviewer training and its technical systems.

Meta assesses that its personnel and technical systems are capable of supporting content moderation at the scale and complexity required for Japan.

Effectiveness

Meta assesses that the personnel and technical measures supporting its Transmission Prevention Measures were effective during the reporting period.

- Proactive detection: The majority of enforcement actions continued to be initiated through Meta's automated detection systems, demonstrating that Meta's technical measures effectively reduce the prevalence of policy-violating content on its Services beyond what is identified through user reports alone.
- Japan-specific enforcement operations: Meta conducted targeted enforcement operations to address specific categories of violations observed in the Japanese market during the reporting period, including the removal of advertisements violating Meta's policies on regulated goods and services, and proactive enforcement actions to protect child safety. These operations were initiated on the basis of identified trends and involved dedicated investigative and review resources.
- Continuous improvement: During the reporting period, Meta also invested in enhancements to its reviewer training and guidance to improve the accuracy and consistency of review outcomes.

The combination of automated detection systems, targeted local enforcement, and personnel training demonstrates that Meta's technical and personnel measures effectively reduce the prevalence of policy-violating content beyond what is identified through user reports alone. Meta continues to invest in strengthening these capabilities.

10.2.5 Details of the Standards for Implementation of Transmission Prevention Measures (Ord. Art. 18(6)(v))

Under Article 18(6)(v) of the Ordinance, Meta is required to assess the details of standards for implementation of Transmission Prevention Measures. Our Community Standards set out when Meta will take Transmission Prevention Measures. Meta assesses this based on the criteria of (i) specificity, (ii) clarity, and (iii) comprehensiveness.

Specificity

Our Community Standards are publicly available global content policies that govern what is and is not allowed on Facebook, Instagram, and Threads, published at <https://transparency.meta.com/policies/community-standards/>. As described in Section 5 above, the Community Standards set out specific policy areas with detailed descriptions of the types of content that are prohibited or restricted. Each policy area identifies specific categories of content subject to enforcement, the rationale for the policy, and the applicable enforcement measures — including content removal, content labeling, distribution reduction, and account-level restrictions.

Beyond content-level standards, Meta's enforcement framework also defines the specific circumstances and thresholds that may result in account-level action, including feature restrictions, temporary suspensions, and permanent disablement (i.e. Service Suspension Measures). Meta's strikes-based system (described in Section 5.4.2 above) sets out how violations are counted, how restrictions escalate progressively, and the specific conditions under which account suspension or disablement applies.

Meta assesses that its Community Standards specify the types of information subject to Transmission Prevention Measures, and the standards for Service Suspension Measures, with

sufficient specificity to enable senders/actors and reporters to understand what content is subject to enforcement and under what circumstances account-level measures may also apply.

Clarity

Our Community Standards are written in plain, accessible language designed to be easily understood by users, content creators, and other relevant persons. The policies are published in Japanese and multiple other languages. Each policy area includes explanatory language describing the types of content covered, illustrative examples, and information about how Meta enforces its policies. [Meta Transparency Center](#) and Help Centers provide additional user-facing guidance on how content policies are applied.

Meta assesses that its content standards are written using expressions that can be easily understood by senders/actors and reporters, consistent with the requirements of the Act.

Comprehensiveness

Our Community Standards encompass a broad coverage of policy areas relevant to online safety, including (but not limited to):

- Violence and incitement
- Hate speech
- Bullying and harassment
- Privacy violations (including sharing of personal information without consent)
- Intellectual property (covering copyright and trademark infringement)
- Fraud, scams, and deceptive practices
- Child sexual exploitation
- Spam and inauthentic behavior

The Community Standards include policy areas directly relevant to the rights-infringing content categories specified under the IDPA, including privacy violations and intellectual property. For categories such as defamation, where enforcement typically requires additional contextual assessment, Meta applies tailored review processes for user reports (see Sections 5 and 10.2.4 above).

Meta regularly reviews and updates its Community Standards to ensure they remain effective and responsive to evolving online harms (see Section 9.1 above).

Meta assesses that its content standards are sufficiently comprehensive to address the types of harmful and rights-infringing content typically encountered on digital platforms, including the content categories specified under the Act.

10.2.6 Implementation Status of Transmission Prevention Measures regarding Users in Japan (Ord. Art. 18(6)(vi))

Under Article 18(6)(vi) of the Ordinance, Meta is required to assess the implementation status of its Transmission Prevention Measures with respect to users in Japan. Meta assesses this based on the criteria of (i) operational maturity, (ii) proportionality and consistency of enforcement, and (iii) effectiveness of outcomes.

Operational maturity

OurCommunity Standards define the boundaries of acceptable content and conduct across Facebook, Instagram, and Threads, and have evolved over more than a decade. The enforcement framework underpinning Meta's Transmission Prevention Measures — including automated detection systems, and human review processes — have similarly been operational at scale across Facebook, Instagram, and Threads for many years and was in place throughout the reporting period.

Meta continuously improves its enforcement framework in response to evolving online harms, operational insights, and stakeholder feedback. Updates are informed by input from external experts, civil society organizations, government bodies, Meta's independent Oversight Board, and internal enforcement data. This process of ongoing refinement ensures that Meta's enforcement practices remain current, effective, and responsive to the needs of users in Japan.

Meta assesses that its Transmission Prevention Measures are mature, well-established, and operational with respect to users in Japan.

Proportionality and consistency of enforcement

Meta's enforcement framework is designed to ensure that actions taken are proportionate to the severity of the policy violation and the risk of harm posed to the community. The framework operates on a progressive basis — from content-level measures (such as removal, or labelling) through to account-level measures (such as feature restrictions, temporary suspensions, and permanent disablement). Where content is restricted on the basis of local law rather than a Community Standards violation, Meta may restrict access to content within the relevant jurisdiction. See Section 5.4.2 above for a detailed description of Meta's strikes-based enforcement system, including how strikes are counted, how account-level enforcement escalates, and the circumstances in which accounts are disabled..

During the reporting period, Meta actioned 3,151,120 pieces of content and 16,224,221 accounts from users in Japan (see Tables 4.2 and 4.3 above). Enforcement actions were applied following review against our Community Standards and, where applicable, Japanese law.

Meta assesses that its enforcement practices were applied proportionately and consistently during the reporting period. This assessment is supported by the following:

- The volume of enforcements overturned on appeal, as set out in Table 7.1 above, represents a small fraction of total enforcements, indicating a high rate of accuracy in initial enforcement decisions.

- The data in Table 7.1 does not indicate a significant difference in appeal overturn rates between AI-assisted enforcements and enforcements overall, indicating consistency of outcomes across automated detection systems and human review teams.
- Meta's use of standardized review guidance and decision-making tools, as well as quality assurance processes, supports the consistent application of policies across reviewers and systems.

Effectiveness of outcomes

Meta assesses that the implementation of its Transmission Prevention Measures produced effective outcomes for users in Japan during the reporting period. This assessment is supported by the following:

- Scale of enforcement: During the reporting period, Meta actioned content across a range of policy areas relevant to users in Japan, including through both reactive (report-based) and proactive (detection-based) enforcement. The scale of enforcement activity demonstrates that Meta's systems are actively identifying and addressing policy-violating content in the Japanese market.
- Low prevalence: As set out in Section 10.2.7 below, the global prevalence of policy-violating content on Meta's platforms remained low during the reporting period, indicating that Meta's enforcement systems are effective in limiting the distribution of such content.
- Continuous improvement: Meta made targeted improvements during the reporting period to enhance the effectiveness of its enforcement operations in Japan (see Sections 10.2.2 and 10.2.4 above). Meta will continue to monitor and refine its enforcement practices in future reporting periods.

10.2.7 Prevalence of Violating Content (Ord. Art. 18(6)(vii))

Under Article 18(6)(vii) of the Ordinance, Meta is required to assess the distribution status of information that unjustly infringes another person's rights, information that would violate a law or regulation if distributed, and information that is subject to Transmission Prevention Measures under the standards for implementation of Transmission Prevention Measures that will be announced pursuant to the provisions of Article 26(1) of the IDPA. Meta assesses the distribution status of such content based on the criteria of (i) prevalence, and (ii) responsiveness.

Prevalence

Meta publishes prevalence data bi-annually in its [Community Standards Enforcement Report](#). Prevalence measures the estimated proportion of content views that include policy-violating content. According to the report, across both Facebook and Instagram, prevalence rates

throughout the first two quarters of the reporting period for many measured policy areas were less than 0.1% — equivalent to fewer than 10 views of violating content per 10,000 content views.

Meta's enforcement systems operate globally with the objective of limiting the distribution of rights-infringing content. The prevalence data above supports the conclusion that these systems delivered against that objective during the reporting period.

Responsiveness

Meta also considers how quickly violating content is addressed once identified, as this affects the extent of distribution - content that is removed more quickly reaches fewer users. Meta's automated detection systems identify a significant proportion of policy-violating content proactively (i.e., before it is reported), which limits distribution by reducing the time between publication and enforcement. During the reporting period, proactive detection rates for many measured policy areas exceeded 90% for several high-severity policy areas (as set out in our [Community Standards Enforcement Report](#)).

Meta's enforcement systems are designed to respond to violating content with sufficient speed to limit distribution. The data above supports Meta's assessment that these systems responded with sufficient speed to limit the distribution of violating content during the reporting period.

10.3 Continuous Improvement

Meta is committed to promoting a safe and transparent online environment for users in Japan. These priorities require continuous improvement, informed by feedback from our stakeholders.

Meta notes certain technical limitations have affected its ability to present some data in this report.

- In Tables 2.2, 3.1.1, 3.1.2 and 3.1.3, "Right to honor" and "Feelings of honor" reporting reasons are combined due to a logging issue that prevented us from differentiating between the two categories. Trademark- and copyright-related claims are reported together for similar reasons.
- In Tables 2.2, 3.1.1, 3.1.2, and 3.1.3, the totals include a small number of Requests for which the reporting reason category was not logged due to a technical issue at the time of submission (see footnotes 3, 5, 6, and 7 above).
- It was not technically feasible during the reporting period to measure the precise time taken to reach a no action determination in response to a report (including the time attributable to specialist review), but this limitation did not affect the timeliness of notifications to reporters.
- While the data presented responsive to Article 28 of the Act. relates to reporters in Japan, in one case, i.e., the data on portrait rights claims, it relates to senders/actors in Japan.
- It was not technically feasible during the reporting period to disaggregate actions on content from actions on accounts resulting from regulator requests in Table 5.3.4. This

limitation did not affect the notifications to senders/actors, or the data presented in Tables 4.2 or 4.3.

Meta is actively exploring potential technical solutions to address issues (e.g., data logging) that may have contributed to these limitations and intends to provide further updates in future reports.

More broadly, Meta recognizes that maintaining a safe online environment requires continuous effort. While Meta's safety measures are longstanding, this inaugural report represents a new commitment to transparency in Japan, and Meta looks forward to continuing to strengthen its engagement with users and stakeholders.
